

Spring Boot / Hands-On

- Create a new Spring Boot application.
- The app should have one REST endpoint that returns all pizza-orders (GET).
- A pizza order consists of an ID and a list of order items. An order item has a name (of the pizza) and a quantity.
- The REST controller should inject a service. This service is responsible for generating four pizza orders (hard-coded).
- Implement a second REST endpoint (GET) that returns all pizza orders containing a particular pizza (pizzaName as request parameter).
