

Spring Boot / Hands-On 1

- Create a new Spring Boot application (or use: <https://github.com/spring-fundamentals/spring-boot>).
- The app should have one REST endpoint that returns all pizza-orders (GET).
- A pizza order consists of an ID and a list of order items. An order item has a name (of the pizza) and a quantity.
- The REST controller should inject a service. This service is responsible for generating some random pizza orders (hard-coded).
